Note:

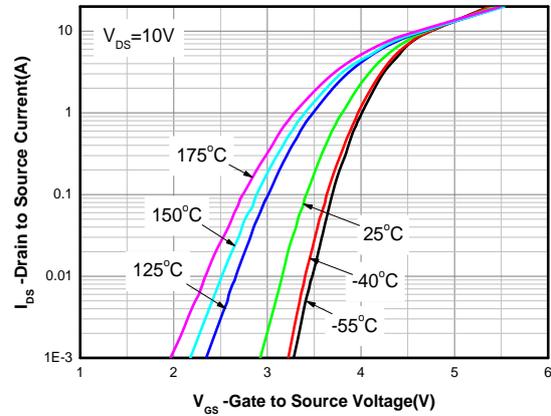

- (1) FR-4 board (38mm×38mm×t1.6mm, 70 μm Copper) partially covered with copper (645mm² area). The power dissipation P_{DSM} is based on Junction-to-Ambient thermal resistance value and the $T_{J(\text{MAX})}=175^\circ\text{C}$. The value is only for reference, any application depends on the user's specific board design.
- (2) The power dissipation P_D is based on $T_{J(\text{MAX})}=175^\circ\text{C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heat sinking is used.
- (3) Repetitive rating, pulsed, duty cycle ~1%, keep initial $T_J=25^\circ\text{C}$, the maximum allowed junction temperature of 175 $^\circ\text{C}$.
- (4) The static characteristics are obtained using ~380 μs pulses, duty cycle ~1%.
- (5) The parameter is not subject to production test – verified by design / characterization.
