

FEATURES

- Input voltage range: 4V to 40V
- Ultra-low quiescent current: 12 μ A (disable WDG)
- Low dropout voltage: 467mV @ 500mA
- Maximum output current: 500mA
- Ultra-low power sleep mode
- $\pm 2\%$ accuracy, Fixed 3.3V and 5V version
- Shutdown current: 1 μ A
- PSRR 66dB @ 100Hz
- Stable loop, requiring only a 4.7 μ F low-ESR output ceramic capacitor
- Enable (EN) pin with 40V withstand voltage
- Current limit, short-circuit protection
- Ambient temperature: -40°C to 125°C
- Thermal shutdown and automatic restart recovery
- Integrated soft start
- Configurable for both window watchdog and standard watchdog
- Window ratio can be configured as 1:1 or 8:1
- Adjustable watchdog period (10ms to 500ms)
- 10% accuracy watchdog period
- $\overline{\text{WD_EN}}$ is dedicated pin for watchdog enable/disable control
- Adjustable PG threshold and PG delay time
- Low input voltage tracking function for UVLO
- PG flag with Programmable Delay, specifically designed for MCU applications
- Available in ETSSOP28 package

DESCRIPTION

The SIT24XX5Q series are watchdog linear regulators (LDO) capable of operating over a wide input voltage range of 4V to 40V. Different models in the series provide fixed output voltages of either 3.3V or 5V, with an output load capability of 500mA. They are suitable for automotive microcontroller or microprocessor power applications.

Under typical application conditions, the quiescent current is only 12 μ A (with watchdog disabled) under no load, and the typical consumption during sleep mode is only 1 μ A.

The series also offers programmable options for either a window or standard watchdog function, using an external resistor to set the watchdog period, with an accuracy of <10%.

The PG output of the SIT24XX5Q series can directly drive the reset pin of a microprocessor (MCU). The PG function integrates fixed delay times and rise/fall thresholds. Alternatively, an external capacitor on the DELAY pin can be used to adjust the PG delay time, and voltage divider resistors on PGADJ can adjust the rise/fall thresholds.

The SIT24XX5Q features integrated current limit and over-temperature protection. In the event of an output short-circuit to ground, the output current is clamped to the current limit value. If the temperature exceeds the safe threshold, the integrated protection mechanism shuts down the LDO until the temperature drops to a safe range, after which normal operation resumes.

The SIT24XX5Q series products are offered in an ETSSOP28 package with an enhanced thermal pad.

PIN CONFIGURATION

Figure 1 SIT24XX5Q Pin configuration

PIN DESCRIPTION

Pin	Symbol	Pin description
1	VIN	Input Power-supply Voltage Pin.
2	NC	No connection.
3	NC	No connection.
4	EN	Enable pin, connect to a logic control signal or to VIN directly.
5	FSEL	Internal oscillator frequency selection pin. Pull this pin down to low-level voltage to select the high-frequency oscillator. Pull this pin up to high-level voltage to select the low-frequency oscillator.
6	WTS	Watchdog type-selection pin. To set the window watchdog, connect this pin to the GND pin. To set the standard watchdog, pull this pin high.
7	NC	No connection.
8	GND	Ground.
9	NC	No connection.

Pin	Symbol	Pin description
10	NC	No connection.
11	ROSC	Watchdog timer adjustment pin. Connect a resistor between the ROSC pin and the GND pin to set the duration of the watchdog monitor. Leaving this pin open or connecting this pin to ground results in the watchdog reporting a fault at the watchdog output (WDO).
12	DELAY	PG Delay Pin. Connect an external capacitor to ground to adjust the PG delay time.
13	WD	Watchdog Signal Input Pin.
14	NC	No connection.
15	WDO	Watchdog Status Pin. Connect an external pull-up resistor to OUT.
16	WD_EN	Watchdog Enable Pin. Active low.
17	NC	No connection.
18	WRS	Window Ratio Adjustment Pin (valid only in window watchdog mode). When pulled low, sets the window ratio to 1:1; when pulled high, sets the window ratio to 8:1.
19	NC	No connection.
20	NC	No connection.
21	GND	Ground.
22	NC	No connection.
23	NC	No connection.
24	PG	Power Good Pin: Connect an external pull-up resistor to OUT.
25	PGADJ	PG Threshold Adjustment Pin. Grounding sets a fixed threshold; connecting a voltage divider chain between OUT and GND to PGADJ adjusts the PG threshold.
26	NC	No connection.
27	NC	No connection.
28	OUT	Output pin.

Note: ETSSOP28 is recommended that the thermal pad is soldered to board ground.

FUNCTION BLOCK DIAGRAM

Figure 2 Internal block diagram of SIT24XX5Q series

FEATURE DESCRIPTION

Overview

The SIT24XX5Q series are ultra-low quiescent current, watchdog-timed low-dropout linear regulators (LDOs) that operate over a wide input voltage range of 4V to 40V. The series features exceptionally low quiescent currents: 1 μ A in shutdown, 12 μ A under no-load with the watchdog disabled, and 21 μ A under no-load with the watchdog enabled.

This product series provides fixed 3.3V or 5V outputs, capable of delivering up to 500mA of load current.

The SIT24XX5Q incorporates a configurable Power Good (PG) function that can directly drive a microprocessor (MCU) reset pin. The PG threshold is programmable via the PGADJ pin, which connects to an external resistor divider from OUT to GND. The divided voltage is compared internally with a 1.1V reference. By altering the divider ratio, users can set a custom PG threshold. If PGADJ is grounded, the device defaults to an internal fixed threshold.

The PG delay time is set using an external capacitor on the DELAY pin to ground. Once the output voltage reaches the PG rise threshold $V_{(PG-RISE)}$, the DELAY pin begins sourcing a charge current. The PG output is allowed to assert high only after the voltage on the DELAY pin reaches its internal rise threshold $V_{(RISE)}$. Users can select a capacitor value based on the MCU's timing requirements. If the DELAY pin is left floating, the device reverts to a fixed internal delay of 250 μ s.

The series offers a programmable watchdog function, selectable as either Window (WTS=0) or Standard (WTS=1) mode. $\overline{WD_EN}$ is provided to control the watchdog enable/disable, and watchdog period is set with an external resistor (ROSC) to ground, with an accuracy better than 10%. The FSEL pin allows adjustment of the internal clock frequency to further modify the watchdog period. In Window mode, the open/close window ratio can be configured as 1:1 (WRS=0) or 8:1 (WRS=1).

During operation, the watchdog can be triggered to start its initialization count by a PG pull-up event, $\overline{WD_EN}$ to 0, or a WDO fault recovery pull-up. The watchdog must be serviced by applying a high-level pulse (>100 μ s) to the WD input pin according to strict timing rules:

1. The first service pulse must occur within the initialization period.
2. In Window mode, subsequent pulses must occur only during the open window period.
3. Pulses are prohibited during the closed window period (Standard mode has no closed window).

If these timing rules are violated, the WDO pin will be pulled low and remain low for a fault period equal to 20% of the watchdog timeout time $t_{(WD)}$. The ROSC pin must not be left floating or directly grounded, as this will cause the WDO pin to be held low continuously.

All watchdog timing parameters are specified in the table below:

	Window watchdog	Standard watchdog
FSEL LOW	$t_{(WD)} = R_{ROSC} \times 0.5 \times 10^{-6}$	
FSEL HIGH	$t_{(WD)} = R_{ROSC} \times 2.5 \times 10^{-6}$	
Watchdog initialization time	$t_{(WD_INI)} = 8 \times t_{(WD)}$	
Open watchdog time $t_{(OW)}$ and Close watchdog time $t_{(CW)}$	$t_{(WD)} = t_{(OW)} + t_{(CW)}$	$t_{(WD)} = t_{(OW)}$
WRS HIGH	$t_{(OW)} = t_{(CW)} = 50\% \times t_{(WD)}$	-
WRS LOW	$t_{(OW)} = 8 \times t_{(CW)} = (8 / 9) \times t_{(WD)}$	-
Fault Duration	$t_{(FLT)} = 20\% \times t_{(WD)}$	

The SIT24XX5Q series features integrated protection functions including current limit, over-temperature shutdown, and automatic restart.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Min	Max	Unit
Input voltage	VIN	-0.3	42	V
Enable voltage	EN	-0.3	VIN	V
Power Good	PG	-0.3	5.5	V
Output voltage	OUT	-0.3	5.5	V
Delay	DELAY	-0.3	5.5	V
